Executive summary

1.0 Project

Land restoration/reclamation monitoring of 11 opencast coal mines of Central Coalfields Ltd. (CCL) producing less than 5 million cu. m. (Coal+OB) per year based on satellite data on every three year basis.

2.0 Objective

Objective of the land restoration/reclamation monitoring is to assess the area of backfilled, plantation, social forestry, active mining area, water bodies, and distribution of wasteland, agricultural land and forest land in the leasehold area of the various opencast projects. This will help in assessing the progressive status of mined out land reclamation and to take up remedial measures, if any, required for environmental protection.

3.0 Salient Findings

- Out of the total mine leasehold area of 5576.06 hectares of the 11 OC projects Viz. Ara, Bhurkunda, Pichri, Pindra, Sirka, Dhori, Bokaro, Kargali, Rajhara, Religera and Sarubera considered for monitoring during year 2013; total excavated area is only 1917.04 hec. Out of which 793.87 ha area (41.41%) has been planted, 551.35 ha area (28.76%) has been backfilled and 571.82 ha area (29.83%) is under active mining. It is evident from the analysis that 70.17% area of the OC projects have already been reclamed and balance 29.83% area is under active mining. Project wise details are given inTable-1 & Fig.-1.
- Of the total area reclamed by CCL, 41.41% is under biological reclamation (plantation) and 28.76% is under technical reclamation. Out of 11 projects of CCL, Bokaro OCP ranks on top for land reclamation (83.35%) followed by Bhurkunda OCP (78.57%) and Kargali OCP (76.54%).

Figure 1: Project wise status of Land Reclamation in CCL for the year 2013

1.0 Background

- 1.1 Land is the most important natural resource which embodies soil, water, flora, fauna and total ecosystem. All human activities are based on the land which is the scarcest natural resource in our country. Mining is a site specific industry and it could not be shifted anywhere else from the location where mineral occurs. It is a fact that surface mining activities do affect the land environment due to ground breaking. Therefore, there is an urgent need to reclame and restore the mined out land for its productive use for sustainable development of mining. This will not only mitigate environment for land acquisition by coal companies in future.
- 1.2 Keeping above in view, M/s Coal India Ltd. (CIL) issued a work order vide letter no. CIL/WBP/Env/2011/4706 dated 12.10.2012 for monitoring of opencast mines of less than 5 million m3 per annum capacity (Coal + OB) from the year 2012 at intervals of three years. The result of land reclamation status of all such mines is to be published on the website of CIL, (www.coalindia.in), CMPDI,(www.cmpdi.co.in) and the concerned coal companies in public domain. Detailed reports are to be submitted to Coal India and respective subsidiaries.
- 1.3 Land reclamation monitoring of all opencast coal mining projects would also comply the statutory requirements of Ministry of Environment & Forest (MoEF). Such monitoring would not only facilitate in taking timely mitigation measures against environmental degradation, but would also enable coal companies to utilize the reclaimed land for larger socio-economic benefits in a planned way.
- 1.4 Present report is embodying the finding of the study based on satellite data of the year 2013 carried out for 11 OC projects of Central Coalfields Ltd. Producing less than 5 m.c.m (Coal + OB) per annum.

2.0 Objective

Objective of the land reclamation/restoration monitoring is to assess the area of backfilled plantation, OB dumps, social forestry, active mining area, settlements and water bodies, distribution of wasteland, agricultural land and forest land in the leasehold area of the project. This is an important step taken up for assessing the progressive status of mined land reclamation and for taking up remedial measures, if any, required, required for environmental protection.

3.0 Methodology

There are number of steps involved between raw satellite data procurement and preparation of final map. National Remote Sensing Centre (NRSC), Hyderabad, being the nodal agency for satellite data supply in India, provides raw digital satellite data, which needs further digital image processing for extracting the information and map preparation before uploading the same in the website. Methodology for land reclamation monitoring is given in Fig. 2. Following steps are involved in land reclamation/restoration monitoring:

Figure-2: Methodology of Land Reclamation Monitoring

3.1 Data Procurement:

After browsing the data quality and date of pass on NRSC site, data order is placed to NRSC. Secondary data like leasehold boundary, topo-sheets are procured for creation of vector database.

3.2 Satellite Data Processing:

Satellite data are processed using ERDAS IMAGINE digital image processing s/w v2012. Methodology involves the following major steps:

Rectification & Geo-referencing:

Inaccuracies in digital imagery may occur due to 'systematic errors' attributed to earth curvature and rotation as well as 'non-systematic errors' attributed to satellite receiving station itself. Raw digital images contain geometric distortions, which make them unusable as maps. Therefore, geo-referencing is required for correction of image data using ground control points (GCP) to male it compatible to SOI topo-sheet.

Image Enhancement:

To improve the interpretability of the raw data, image enhancement is necessary. Local operations modify the value of each pixel based on brightness value of neighbouring pixels using ERDAS IMAGINE 9.3 s/w and enhance the image quality for interpretation.

Training set Selection

Training set requires to be selected, so that software can classify the image data accurately. The image data are analysed based on the interpretation keys. These keys are evolved from certain fundamental image elements such as tone/colour, size, shape, texture, pattern, location, association and shadow. Based on the image- elements and other geo-technical elements like land form, drainage pattern and physiography; training sets were selected/identified for each land use/cover class. Field survey was carried out by taking selective traverses in order to collect the ground information (or reference data) so that training sets are selected accurately in the image. This was intended to serve as an aid for classification.

Classification and Accuracy Assessment

Image classification is carried out using the maximum likelihood algorithm. The classification proceeds through the following steps: (a) calculation of statistics [i.e. signature generation] for the identified training areas, and (b) the decision boundary of maximum probability based on the mean vector, variance, covariance and correlation matrix of the pixels. After evaluating the statistical parameters of the training sets, reliability test of training sets are conducted by measuring the statistical separation between the classes that resulted from computing divergence matrix. The overall accuracy of the classification was finally assessed with reference to ground truth data.

Area calculation

The area of each land use class in the leasehold is determined using ERDAS IMAGINE v2012 s/w and given in table 2.

Overlay of Vector database

Vector data base created based on secondary dat. Vector layer like railway line, settlements, forest boundary, leasehold boundary, roads, drainage etc. are superimposed on the image as vector layer in the ArcGIS database.

Pre-field map preparation

Pre-field map is prepared for validation of classification result

3.3 Ground Truthing:

Selective ground verification of the land use classes are carried out in the field and necessary corrections if required, are incorporated before map finalization.

3.4 Land reclamation Database on GIS:

Land reclamation database is created on GIS platform to identify the temporal changes identified from satellite data of different cut-off dates.

4.0 Land Reclamation Status of Central Coalfields Ltd.

Following 11 OC Projects producing less than 5 million m³ (Coal +OB) of Central Coalfields Ltd. Have been taken up during the year 2013 for land reclamation monitoring:

- Ara
- Bhurkunda
- Pichri
- Pindra
- Sirka
- Dhori
- Bokaro
- Kargali
- Rajhara
- Religera
- Sarubera
- 4.1 Area statistics of different land use classes present in OC projects in the year 2013 is given in table 2. Land use maps derived from the satellite data is given in Plate No. 1 to 11. Land use statuses are shown in fig. 3-13 and field photographs showing plantation and backfilled area in mining project is shown in Photos 1-6.
- **4.2** Study reveals that 70.17% of excavated area has already been reclaimed by CCL in the OC Projects, out of which 41.41% area has been planted and 28.76% area are backfilled.
- 4.3 After analyzing the satellite data of the year 2013, it is evident that plantation carried out on backfilled area, OB dumps as well as under social forestry in all the 11 mines of CCL taken for study, has reached 41.41% till now. It can also be seen from table 1 that the total area of reclamation has reached 70.17% till the year 2013.
